CAPITAL BRIDGE™
Strength Behind Every Structure

CAPITAL HEALTH — STRATEGIC WEALTH REPORT

Withdrawal sustainability and capital trajectory under your stated assumptions.

Prepared for: **Client**

Generated: **17 April 2026 at 9:44 PM**

CONTENTS

Section A — Opening
- Advisory framework context
- Executive summary

Section B — Advisor Read
- Capital structure diagnosis
- Structural confidence
- Capital health summary
- Charts and drivers

Section C — Deeper analysis
- Assumptions
- Scenario context

Appendix & closing

SECTION A — OPENING

Opening

What this shows

Step 2 in the Capital Bridge journey — structural durability after Income Engineering — then your executive summary on the following page.

Why this matters

Sets context before diagnosis and charts so the report reads as one clear story, consistent with Forever, Income Engineering, and Capital Stress.

CAPITAL BRIDGE PLANNING JOURNEY

How to read this report

Step 2 — Is your structure strong enough?

This report follows Income Engineering (Step 1B), where income and capital flow are structured.

At this stage, the question becomes:

- Is the structure sustainable over time?
- Do withdrawals exceed what the portfolio can support?
- How long can capital last under current assumptions?

WHAT THIS MODEL DOES

The Capital Health Model shows how these parts interact:

- withdrawals
- capital base
- expected returns

over time. It focuses on how long your capital can last, not short-term noise.

WHY THIS MATTERS

Even strong income structures can fail if withdrawals exceed sustainable returns.

This model allows:

- Whether withdrawals are sustainable
- Where capital depletion risk appears early
- Which gaps to fix before they compound

WHAT HAPPENS NEXT

From here:

- Capital Stress → tests how this structure behaves under changing market conditions

EXECUTIVE SUMMARY

Overall Structural Status: Critical

Based on the assumptions provided, the current withdrawal structure places meaningful pressure on the portfolio. A withdrawal of RM10,000 per month with expected returns of 8.0% produces a projected capital runway of 4 years 11 months. The model identifies a structural income gap where withdrawals exceed sustainable portfolio returns, resulting in progressive capital depletion. Adjustments to income, capital base, or portfolio returns would materially improve the resilience of the structure.

SECTION B — CORE READ

Core Read

What this shows

Diagnosis, confidence strip, and summary cards built from the same withdrawal and return assumptions you entered.

Why this matters

This is the shared fact base for the meeting — clear numbers before optional Lion narrative and scenario pages.

CAPITAL STRUCTURE DIAGNOSIS

Capital Structure Status	**Critical**
Lion score (0–100)	0 · NOT SUSTAINABLE
Income Gap	RM7,050
Capital Runway	4 years 11 months

This diagnostic assessment evaluates whether the withdrawal structure is sustainable under the portfolio's expected return assumptions.

STRUCTURAL CONFIDENCE

Lion score: 0 / 100 · NOT SUSTAINABLE

STRONG · STABLE · FRAGILE · AT RISK · NOT SUSTAINABLE

Lion score is mapped from the model risk tier; same scale as Lion's Verdict in the app.

CAPITAL HEALTH SUMMARY

CAPITAL RUNWAY

4 years 11 months

CAPITAL SURVIVAL AGE

Capital Survival Age 59

INCOME SUSTAINABILITY

Sustainable Monthly Return RM2,950

Income Gap RM7,050

© Capital Bridge. All rights reserved. Capital Bridge™ and associated marks are proprietary. Unauthorised use, reproduction, or distribution is prohibited.

STRUCTURE OVERVIEW

Desired Monthly Income RM10,000

Sustainable Monthly Return RM2,950

Income Gap RM7,050

Projected Capital Depletion 4 years 11 months

Income Gap represents withdrawals exceeding sustainable portfolio returns. Persistent gaps accelerate capital depletion and weaken long-term capital resilience.

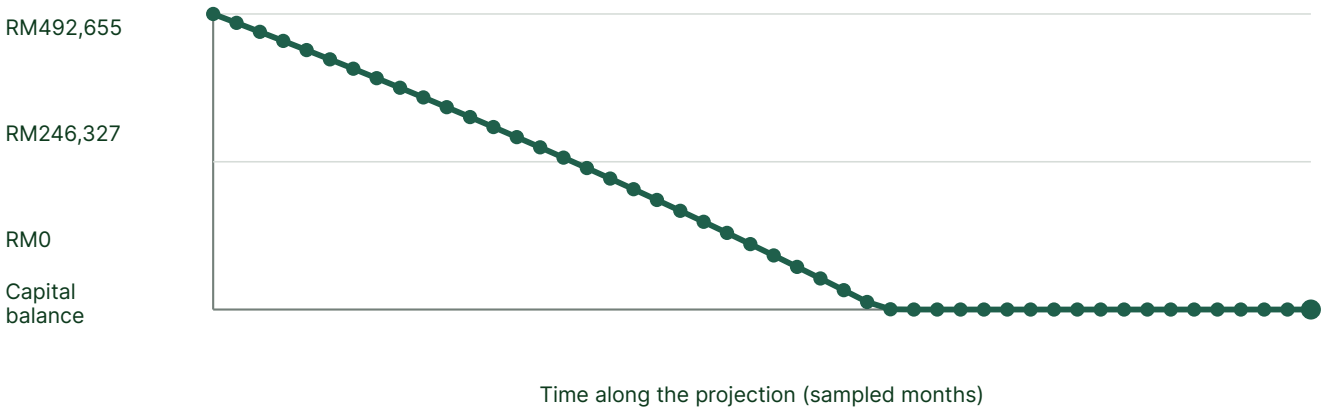
CAPITAL PROJECTION OVER TIME

What this shows

Modelled portfolio capital through time under your withdrawal and return assumptions — the same story as Section B, in one strip.

Why this matters

A flat or rising strip supports the sustainability narrative; a clear downward trend signals depletion pressure worth discussing in your plan.



End at year 8

End-point snapshot

Month 94: RM0 — compare to starting capital and sustainable return assumptions.

Interpretation

Each point shows projected capital at that month. A flatter path signals stronger resilience. A steeper decline signals faster depletion pressure. The end-point year and amount show where this trajectory lands under your current assumptions.

SECTION C — DEEPER ANALYSIS

Deeper analysis

What this shows

Explicit assumptions, structure detail, optimiser logic, and stress context behind the Section B headline.

Why this matters

Lets you stress-test the story: which inputs would change the conclusion, and what the model did with your settings.

MODEL ASSUMPTIONS

Model Mode	Monthly Withdrawal	Expected Annual Return	8.0%
Currency	RM (RM)	Inflation Adjustment	Off
Desired Monthly Income	RM10,000	Cash Buffer	15%
Starting Capital	RM500,000	Cash Return	3.5%
Monthly Top-Up	RM0	Withdrawal Rule	Fixed amount

Portfolio Structure: 85% invested at 8.0% · 15% liquidity buffer earning 3.5%

RUNWAY SENSITIVITY

Inflation adjustment: OFF.

Runway without inflation: 38 years 7 months.

Runway with inflation: 38 years 4 months.

Impact of inflation on runway: shorter by 3 months.

Inflation increases the pressure on withdrawals over time, which can shorten how long your capital lasts.

CAPITAL AT HORIZON
RM0

OUTCOME OPTIMISER

Withdrawal adjustment

Aligning draw with sustainable portfolio income may extend runway. For context, the model illustrates approximately RM2,950 per month — confirm in your plan; it is not a fixed instruction.

Capital adjustment

Additional capital of approximately RM1,638,225 may improve sustainability under current assumptions.

This is typically built progressively through income surplus, asset optimisation, or structured capital deployment. Refer to Income Engineering for pathways to unlock or build capital over time.

Return adjustment

The model indicates that significantly higher returns (e.g. ~27.6%) would be required to fully close the gap.

In practice, very high implied returns are unlikely to be sustainable. Portfolio strategy may be reviewed to optimise within realistic ranges (e.g. 6–10%), while combining capital and income adjustments.

Balanced pathway

One illustrative combined adjustment is income −30% and capital +30% (from the live model) — use for discussion, not as a mandate.

These rows illustrate structural trade-offs for discussion — not prescriptive advice.

CAPITAL STRESS TEST

Scenario	Annual Return	Capital Survival Age
Conservative Market	4.0%	37 years 11 months
Base Case	8.0%	38 years 7 months
Aggressive Market	10.0%	38 years 11 months

Stress test framing: Bear, Base, and Bull are scenario lenses, not promises. They show how survival time can change under different return environments and are quick structure tests, not forecasts.

CAPITAL PROTECTION WARNING

Current withdrawal levels exceed sustainable portfolio returns.

Without structural adjustments, capital depletion is projected within 4 years 11 months.

Investors should review withdrawal levels, capital base, or portfolio return assumptions to prevent long-term erosion of capital.

THE LION'S VERDICT

Lion score: 0 / 100 · NOT SUSTAINABLE

"The Lion Warns. Reinforce Before Strain."

SUMMARY

Withdrawals of RM10,000/month exceed sustainable portfolio returns of RM2,950/month, creating a structural income gap of RM7,050.

WHY THIS IS HAPPENING

Withdrawals exceed sustainable portfolio returns; capital depletion is projected.

SYSTEM STATE

Structural band: Critical. Income structure projected to deplete capital in 4 years 11 months.

WHAT YOU CAN DO NEXT

- Review withdrawal levels in your plan — the model highlights approximately RM2,950/month as one path toward sustainability under current assumptions.
- Strengthen the capital base progressively — an estimated RM1,638,225 would materially extend runway, typically built over time via income surplus or capital optimisation (relook at Income Engineering Model).
- Review return assumptions — while higher returns improve outcomes, the diagnostic implied rate to close the gap purely via return is approximately 27.6%; focus on realistic ranges (e.g. 6–10%) and combine with structural adjustments rather than relying on return alone.

© Capital Bridge. All rights reserved. Capital Bridge™ and associated marks are proprietary. Unauthorised use, reproduction, or distribution is prohibited.

WHAT YOU CAN DO NEXT

Recommended Next Steps

1. Review withdrawal strategy — Aligning draw with sustainable portfolio income can extend runway on these assumptions (one illustrative level the model highlights is around RM2,950 per month).

2. Strengthen capital base over time — An estimated RM1,638,225 would materially extend runway under these assumptions; typically built progressively (see Income Engineering for pathways).

3. Review return assumptions — The diagnostic implied rate to close the gap purely via return is approximately 27.6%; treat cautiously, stay within realistic ranges (e.g. 6–10%), and combine with structural adjustments.

4. Conduct periodic review — Reassess assumptions annually or when circumstances change.

PRIMARY DISCUSSION POINT

Withdrawal alignment (illustrative)

The model highlights approximately RM2,950 per month as one path toward sustainability — confirm suitability in your plan and your broader plan.

Why it matters

Lower draw reduces depletion pressure and can materially extend runway under the same return assumptions.

HOW TO INTERPRET THESE RESULTS

Recommendations should be evaluated within the client's broader financial plan:

- Exploring withdrawal alignment with sustainable portfolio returns
- Building or redeploying capital over time to extend runway (Income Engineering)
- Reviewing portfolio strategy and return assumptions within realistic ranges
- Extending the investment horizon where appropriate

CAPITAL BRIDGE SYSTEM OVERVIEW

Capital Bridge functions as a financial modelling and diagnostic platform designed to evaluate capital sustainability and income resilience.

The system integrates capital projections, withdrawal modelling, and structural diagnostics to support decision-making.

DISCLOSURES AND HOW TO USE THIS REPORT

This section explains how to read the report and which assumptions to review first.

How to use this report

- Review structural diagnostics and charts in your plan.
- Refresh the live model when withdrawals, returns, or horizon change materially.

This report is for advisory purposes only. All illustrations are based on your assumptions and are not a guarantee of future outcomes. The footer on each page contains the legal notice.
