CAPITAL BRIDGE™

Strength Behind Every Structure

CAPITAL STRESS — STRATEGIC WEALTH REPORT

How your capital may behave under stress — withdrawals, time horizon, and range of outcomes from the assumptions below.

Prepared for: **Sample Client**

Generated: **7 April 2026 at 16:13**

CONTENTS

Section A — Opening

- Advisory framework context
- Trial or paid: The Lion's Verdict

Section B — Advisor Read

- Executive summary and key metrics
- Capital trajectory
- Stress scenarios and adjustments
- Signals and recommended focus

Section C — Deeper analysis

- Monte Carlo context
- Scenario methodology

Appendix & closing

SECTION A — OPENING

OPENING

What this shows

Step 3 in the Capital Bridge journey — how your structure behaves under many simulated paths — then headline metrics and charts on the same assumptions.

Why this matters

Sets the advisory thread before Section B numbers and Section C visuals, consistent with Forever, Income Engineering, and Capital Health.

CAPITAL BRIDGE ADVISORY JOURNEY

How to read this report

Step 3 — How does your structure behave under stress?

This report follows:

- Step 1 — Forever Income (Can your structure last?)
- Step 1B — Income Engineering (How can capital be structured?)
- Step 2 — Capital Health (Is the structure sustainable?)

At this stage, the question becomes:

- What happens if markets move against you?
- How stable is your structure across different scenarios?
- Where does pressure begin to emerge over time?

WHAT THIS MODEL DOES

The Capital Stress Model simulates many possible market paths using your current assumptions.

It shows:

- how capital may evolve under uncertainty
- how often outcomes fall within expected ranges
- where downside risk becomes meaningful

WHY THIS MATTERS

A structure that works in one scenario may not hold across many.

This model allows:

- resilience to be tested beyond a single projection
- downside risk to be understood clearly
- confidence to be built before execution

THE LION'S VERDICT

Lion score: 100 / 100 · STABLE

"The lion stands protected on all sides. No weakness is exposed. Stability is certain."

SUMMARY

Your current structure produces RM9,525 against RM50,000, leaving a deficit of RM40,475.

No dependency on favourable conditions. Outcomes remain consistent. The structure is reliable.

WHY THIS IS HAPPENING

This deficit exists because expenses exceed income, requiring capital drawdown of RM40,475 per month.

SYSTEM STATE

Lion Score: 100 · STABLE

WHAT YOU SHOULD DO NEXT

Repair the RM40,475 monthly funding gap by lifting recurring income or cutting committed expenses. Lion score 100 places the structure in the strong band, so the next move is to protect surplus and sharpen efficiency.

✓ Capital structure absorbs moderate volatility

CONFIDENCE NOTE

Where your structure remains stable across multiple simulated paths, this indicates a level of robustness under varied conditions.

While no model can remove uncertainty, alignment across sustainability, structure, and stress testing provides a stronger basis for moving forward with discipline.

SECTION B — ADVISOR READ

ADVISOR READ

What this shows

Headline resilience metrics, plain-language interpretation, and the scenario assumptions this report used.

Why this matters

The adviser's read of outcomes comes before the evidence charts in Section C.

KEY OUTCOMES

EXECUTIVE SUMMARY

Structure read	**Strong**
Lion score	**100 · STABLE**
Depletion pressure	**Stable**
Typical path outcome	**RM1,143,038**

STRATEGIC INTERPRETATION

ADVISOR READ

The capital structure appears strong or stable under the current assumptions and is well positioned for the selected horizon.

Key risk drivers are within a manageable range.

Consider periodic reviews to keep assumptions aligned with goals.

© Capital Bridge. All rights reserved. Unauthorised use or distribution of proprietary content and outputs is prohibited.

ASSUMPTIONS CAPTURED HERE

The model explores many possible paths — not one forecast — given your capital, withdrawals, horizon, return range, and inflation.

Monte Carlo simulation: 3,650 possible paths tested

Starting capital	RM1,000,000
Yearly withdrawal	RM50,000
Time horizon	10 years
Return range (assumed)	-2.0% to 7.0%
Inflation (assumed)	1.5% p.a.

This model evaluates a wide range of potential market conditions based on your assumptions — not a single forecast.

© Capital Bridge. All rights reserved. Unauthorised use or distribution of proprietary content and outputs is prohibited.

SECTION C — DEEPER ANALYSIS

DEEPER ANALYSIS

What this shows

Charts and tables that unpack resilience: diagnosis, how capital may evolve, and what happens if key assumptions worsen.

Why this matters

Gives you concrete visuals to discuss tail risk and trade-offs — still anchored to the Section B headline.

SCENARIO SUMMARY

SCENARIO SUMMARY

Structure Health	Time Horizon	Typical Outcome
Strong	10 years	RM1,143,038
Initial Capital	**Depletion Pressure**	**Withdrawal**
RM1,000,000	Stable	RM50,000

VISUAL ANALYSIS

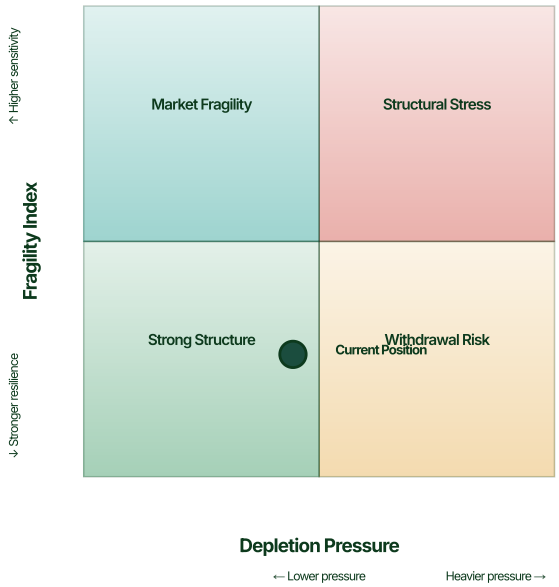
STRUCTURAL STABILITY MAP

What this shows

Where this scenario sits on withdrawal pressure versus market sensitivity — the same headline read you saw with the Lion in Section A, shown as a simple map.

Why this matters

Shows whether the story is driven more by spending pressure, market sensitivity, or both — a useful anchor before the curves and tables below.



Current Position: Strong Structure Zone

Fragility Index: 26 · Depletion Pressure: Stable

Interpretation

Horizontal axis: lighter to heavier withdrawal pressure. Vertical axis: stronger resilience (lower) to higher market sensitivity (upper). Depletion label: Stable (-13.9%).

© Capital Bridge. All rights reserved. Unauthorised use or distribution of proprietary content and outputs is prohibited.

SIMULATED AVERAGE OUTCOME

RM1,143,038

After inflation (1.5% p.a.): RM984,918

POSSIBLE CAPITAL OUTCOMES

Typical (median): RM1,158,761

Middle 50% range: RM1,102,808 – RM1,213,018

Conservative (5th %): RM943,418

Upside (95th %): RM1,260,789

CAPITAL DURABILITY CURVE

What this shows

Typical capital path through time, with bands for the middle range of outcomes and a wider outer band for stress.

Why this matters

Withdrawals and returns interact over the horizon — this chart shows how wide that story can be, not just the middle case.

Interpretation

Year 0 — Year 10. Inner shading: where roughly half of outcomes fall; outer shading: a wider stress range.

Capital Survival Probability

In about 100% of paths tested, capital stays positive through the full 10-year horizon. The Resilience Score blends that survival read with how often capital stays above half of where you started — so it reflects both running out and being worn down.

© Capital Bridge. All rights reserved. Unauthorised use or distribution of proprietary content and outputs is prohibited.

CAPITAL OUTCOME PROBABILITY DISTRIBUTION

What this shows

How often test paths finish with different ending capital amounts.

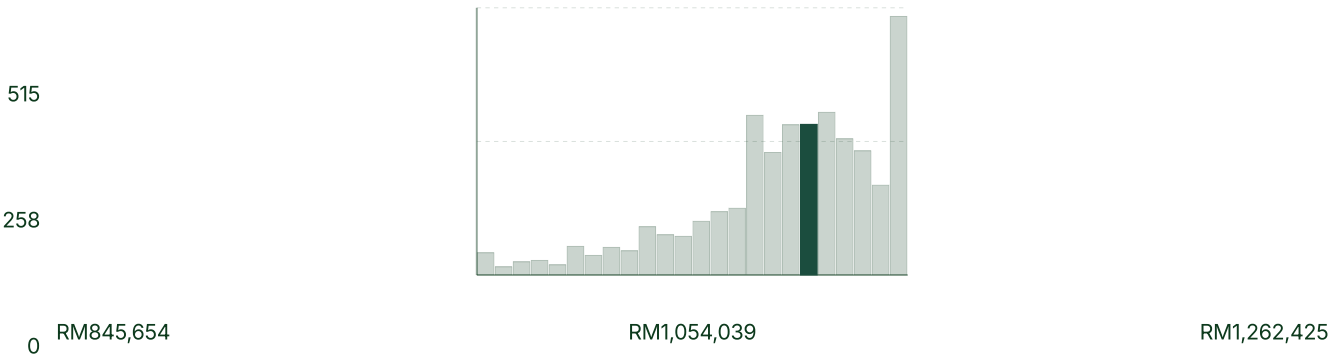
Why this matters

A tight cluster means similar endings; weight on the left means more paths finish with little capital — worth discussing with your adviser.

Each bar is a band of **ending capital** after 10 years; bar height is how many of the 3,650 tested paths landed there. The **highlighted** bar sits in the band that contains the **typical (median)** outcome.

Vertical scale: how many paths ended in each band

Taller bars mean more paths finished near that level of capital; short bars mean that ending was uncommon.



Horizontal axis: ending capital (24 steps from lowest to highest ending balance in the test).

Typical outcome (median)

RM1,158,761 — the highlighted bar marks the band that holds this typical ending. If the tallest bars sit left of it, more paths end below typical; if weight sits to the right, more paths end above typical.

How to read this: One tall peak means most paths end near the same place; a wide spread means endings vary a lot. Heavy weight near the left means many paths finish with little capital — weigh that against how much downside you can live with. Use this together with the percentile summary above.

Interpretation

Use the highlighted median band together with bar shape: one tall peak means most paths land near the same ending; a wide spread means more dispersion — always read alongside the headline percentiles in Section B.

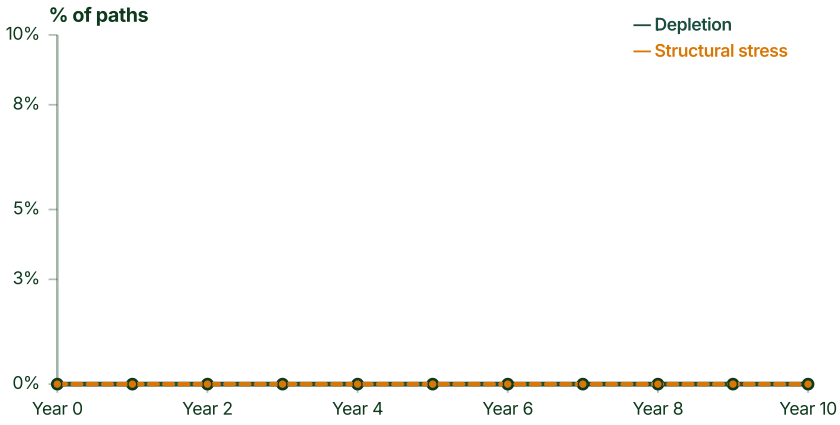
CAPITAL STRESS TIMELINE

What this shows

Year-by-year probability of depletion versus structural stress.

Why this matters

Shows when stress tends to appear later in the horizon, not only at the end.



Interpretation

Two metrics by year: probability of full capital depletion (balance ≤ 0) and probability of structural capital stress (capital below 50% of initial).

Solid line: probability of full capital depletion. Dashed line: probability of structural capital stress (capital below 50% of initial). Early stability means low percentages; rising stress means increasing percentages over time.

While full capital depletion may remain unlikely under current assumptions, the probability of structural capital stress can gradually increase later in the investment horizon.

Capital Breakpoint Indicator

Under current assumptions, structural stress remains below the critical threshold through the 10-year horizon.

The Capital Breakpoint indicates the approximate year when structural stress would begin to emerge across simulated scenarios. In this scenario, depletion probability stays under the threshold for the full period.

PROJECTED CAPITAL VS STARTING CAPITAL

Simulated average ending capital vs initial: 114.3%

SIMULATED CAPITAL JOURNEY

What this shows

Median-year account balances along the modelled path.

Why this matters

Gives a concrete year-by-year trajectory to pair with the statistical charts above.

Year	Est. Return %	Account Balance
0 Yr	—	RM1,000,000
1 Yr	5.93%	RM1,009,292
2 Yr	5.96%	RM1,019,443
3 Yr	6.89%	RM1,039,678
4 Yr	6.87%	RM1,061,151
5 Yr	6.90%	RM1,084,411
6 Yr	5.88%	RM1,098,191
7 Yr	5.80%	RM1,111,844
8 Yr	5.81%	RM1,126,463
9 Yr	5.76%	RM1,141,307
10 Yr	5.91%	RM1,158,766

Interpretation

Typical market path (median outcomes). Rows stop when capital reaches zero.

CAPITAL STRESS RADAR

What this shows

Relative sensitivity scores across five structural risk drivers.

Why this matters

Highlights which levers (returns, withdrawals, inflation, volatility, drawdown) dominate vulnerability.

Interpretation

Higher scores on a spoke mean greater vulnerability on that driver — use it to decide what to validate first with the client.

© Capital Bridge. All rights reserved. Unauthorised use or distribution of proprietary content and outputs is prohibited.

FURTHER STRUCTURAL STRESS TEST

What this shows

Ending capital and depletion pressure under stressed assumption rows.

Why this matters

Shows directional impact when returns, withdrawals, or inflation move against you.

Stress Driver	If Stress Level	Depletion Pressure	Ending Capital
Market Returns	Return decreases by 1%	-7.9%	RM1,006,789
	Return decreases by 2%	-1.4%	RM885,550
Withdrawals	Withdrawal increases by 10%	-9.9%	RM1,076,558
	Withdrawal increases by 20%	-5.9%	RM1,011,739
Inflation	Inflation increases to 3%	+5.3%	RM781,288
	Inflation increases to 5%	+17.8%	RM589,281

Interpretation

How the capital structure responds when key assumptions deteriorate.

© Capital Bridge. All rights reserved. Unauthorised use or distribution of proprietary content and outputs is prohibited.

NEXT STEPS

KEY TAKEAWAYS

Withdrawal pressure increases fragility over longer horizons.
Median outcomes suggest capital preservation or growth under the assumed return range.
The 10-year horizon and return assumptions drive the dispersion of outcomes.

RECOMMENDED ADJUSTMENTS

Maintain a capital buffer for unexpected stress.
Revisit assumptions if circumstances change.
Optimise allocation for long-term resilience within your risk tolerance.

© Capital Bridge. All rights reserved. Unauthorised use or distribution of proprietary content and outputs is prohibited.

APPENDIX & CLOSING

DISCLOSURES AND NEXT STEPS

What this shows

How to use this report, regulatory context, and the next step in the Capital Bridge journey.

Why this matters

Closes with a clear handoff: what this document is for, and where to go next with your adviser.

CLOSING

Disclosures & how to use this report

This document comes from the Capital Bridge Capital Stress model and is meant for discussion with your adviser. It is not personal advice. The footer carries the full legal notice.

How to use this report

Use it with your adviser to stress-test withdrawals, horizon, and return assumptions.

Treat paths as illustrative; update the live model when inputs change materially.

RECOMMENDED NEXT STEP — STRATEGIC EXECUTION

At this stage, your structure has been:

evaluated for sustainability
engineered for capital flow
tested under stress

When the structure remains coherent across these stages, the next step is execution.

Execution focuses on:

implementing the capital structure
aligning assets and income flows
maintaining discipline over time

Next: Proceed to Strategic Execution to implement your plan.
